(RS/EO) Data to Monitor and Report Landscape Dynamics in and Around Protected Areas**

NPP is the balance between photosynthesis and respiration by plants

A substantial incentive to understand trends and variability in terrestrial Net Primary Production, because NPP:

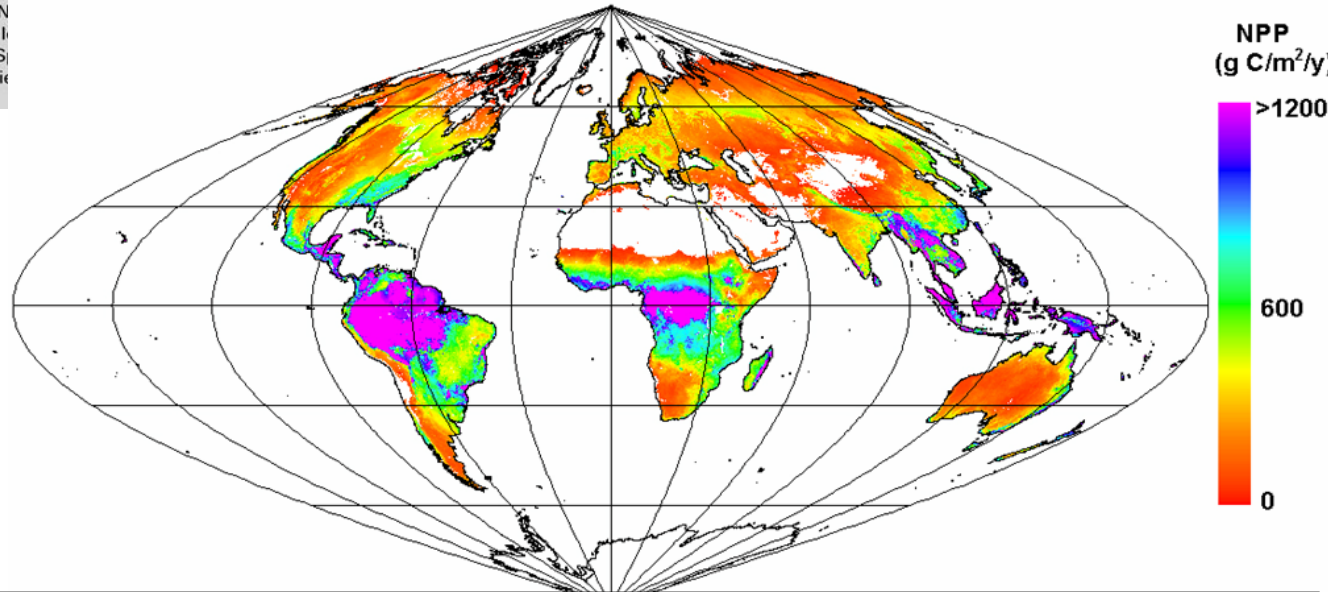

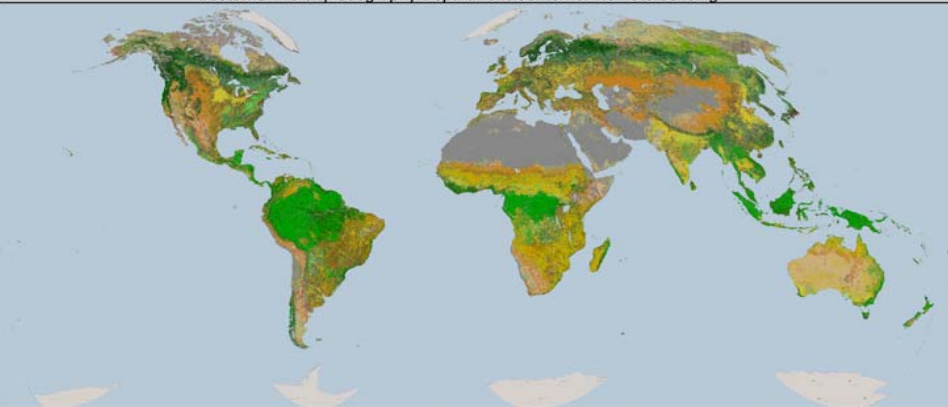

image credit: fao

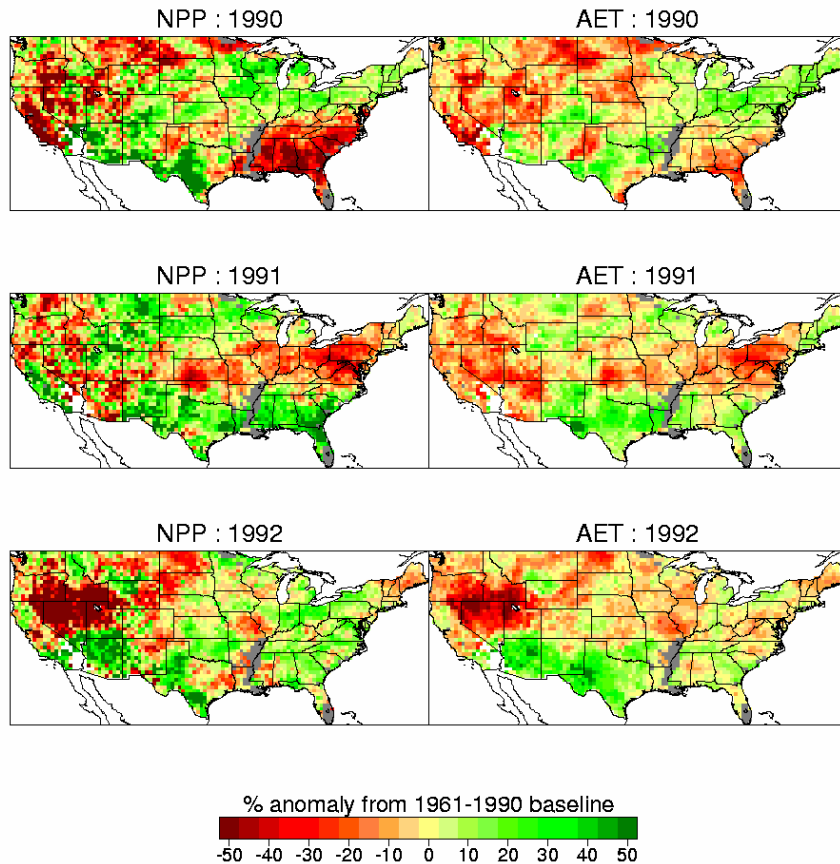

- is the foundation of food, fiber and fuel for human consumption
- determines seasonal and interannual variations in atmospheric CO₂
- integrates climatic, ecological, geochemical and human influences on the biosphere

Long-term climate + geology produce distinct patterns of vegetation and NPP

NPP Database

Overview of the NPP Project

The ORNL DAAC Net Primary Production (NPP) Database contains field measurements of biomass and estimated NPP for terrestrial sites worldwide, compiled from published literature and other extant data sources. It includes intensively studied and

well-documented field study sites, together with more extensive collections of worldwide data. Compilation of these data was sponsored by the Terrestrial Ecology Program of [NASA's Office of Earth Science](#).

In-Depth

The NPP Database contains data for 61 intensive study sites. The majority of these sites are grasslands, the remainder being located in tropical forest, boreal forest, and tundra. Some combination of above-ground annual peak live biomass data and/or seasonal biomass dynamics data are available for all sites. Many sites also have data on below-ground biomass and/or turnover. A number of previously compiled multi-site, multi-biome data sets of georeferenced NPP estimates are also provided. [More](#)

CASA-CQUEST Viewer: A Decision Support Tool for Carbon Management

The development of the CASA-CQUEST Decision Support Tools (DST) relies on “baseline” outputs and CO₂ flux predictions from the EOS-driven NASA-CASA model (Potter et al., 2003). CQUEST is an internet-based query and modeling application that allows users to display, manipulate, and save ecosystem model estimates of carbon sinks and CO₂ fluxes in agricultural and forest ecosystems for locations anywhere in the United States freely from a web browser. Users are able to customize the map views, navigate, overlay multiple data layers, print images, and obtain data values from any carbon map data layers in tabular format. <http://geo.arc.nasa.gov/website/cquestwebsite/>

What is Ecocasting?

Ecological forecasting (or 'ecocasting') is the prediction of ecosystem parameters. NASA Ames is developing advanced computing technologies for converting massive streams of satellite remote sensing data into ecocasts that are easy to read and use.

NASA Ames, UWF IHMC, CMU, CSUMB, UMT, UW, and Fetch Technologies are collaborating to develop a distributed computing [architecture](#) for the production of ecocasts from satellite remote sensing data and other ancillary data sources. [Applications](#) of the Ecocast technology include fire forecasting, crop quality forecasting, snowpack and flood monitoring, and identification of anomalies in the carbon cycle and other biospheric processes.
